ABSTRACT:

PURPOSE: To omit the addition of identification names to the transaction data by registering the identification names of the first and second transactions into a transaction information store area.

CONSTITUTION: A start transaction information defining means 2 registers the identification name of the transaction that is first started into a transaction information store area 8 for each user. Meanwhile a next transaction information store means 3 registers the identification name of the transaction that is started next. Furthermore a transaction information initialization means 4 sets the identification name of the transaction that is started next to the identification name of the transaction that is started first. A transaction identifying means 6 decides the transaction to be executed based on the information stored in the area 8 or the input data. Then a transaction processing means 7 carries out each transaction. In such a constitution, a transaction processing system can be applied without inputting the identification name of a transaction as a part of the transaction data.
